Diagram Montrant le fonctionnement de l'application

Routes Pour notre API, Type de requête et Réponses Produites

- Obtenir le nom des tables
- requête **HTTP GET** Vers:
- <http://localhost:5000/api/tables>

```
1  [
2    {
3      "table_name": "paiement"
4    },
5    {
6      "table_name": "salles"
7    },
8    {
9      "table_name": "cb"
10   },
11   {
12     "table_name": "materiels"
13   },
14   {
15     "table_name": "planning_salles"
16   },
17   {
18     "table_name": "reservations"
19   },
20   {
21     "table_name": "factures"
22   },
23   {
24     "table_name": "clients"
25   },
26 ]
```

- Obtenir les details sur les attributs present dans une tables.
- requête **HTTP GET** Vers:
- <http://localhost:5000/api/fullsend/clients>

```
1 [
2   {
3     "number": 1,
4     "name": "idclient",
5     "attnum": 1,
6     "notnull": true,
7     "type": "integer",
8     "primarykey": "true",
9     "uniquekey": "false",
10    "foreignkey": "false",
11    "foreignkey_fieldnum": null,
12    "foreignkey_connum": null
13  },
14  {
15    "number": 2,
16    "name": "nom",
17    "attnum": 2,
18    "notnull": true,
19    "type": "character varying(30)",
20    "primarykey": "false",
21    "uniquekey": "false",
22    "foreignkey": "false",
23    "foreignkey_fieldnum": null,
24    "foreignkey_connum": null
25  },
26  {
27    "number": 3,
```

- Obtenir les détails sur la provenance des clés étrangères.
- requête HTTP GET Vers:
- <http://localhost:5000/api/foreignkeys/reservations>

```
1  [
2    {
3      "table_schema": "public",
4      "constraint_name": "fk_id_client",
5      "table_name": "reservations",
6      "column_name": "idclient",
7      "foreign_table_schema": "public",
8      "foreign_table_name": "clients",
9      "foreign_column_name": "idclient"
10   },
11   {
12     "table_schema": "public",
13     "constraint_name": "fk_id_client",
14     "table_name": "reservations",
15     "column_name": "idclient",
16     "foreign_table_schema": "public",
17     "foreign_table_name": "clients",
18     "foreign_column_name": "idclient"
19   },
20   {
21     "table_schema": "public",
22     "constraint_name": "fk_id_client",
23     "table_name": "reservations",
24     "column_name": "idclient",
25     "foreign_table_schema": "public",
26     "foreign_table_name": "clients",
27     "foreign column name": "idclient"
```

- Utiliser pour envoyer des données de connexion depuis le frontend.
- requête **HTTP POST** Vers:
- `http://localhost:5000/api/submit`

```
Pretty Raw Preview Visualize HTML   
1 i got some data from your frontend
```

React X-arrows fonctionnement

```
<Xarrow  
  start={box1Ref} //can be  
  react ref  
  end="elem2" //or an id  
>
```

Conclusion

Objectifs Atteint
